## Weak Acid Equilibria

$$
\begin{gathered}
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{A}^{-} \\
K_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}
\end{gathered}
$$

- $K_{a}$ is a constant for a given acid at a particular temperature regardless of the analytical concentration of the acid.
- The magnitude of $K_{a}$ indicates acid strength.
$\checkmark$ Strong acids have $K_{a} \gg 1$.
$\checkmark$ Weak acids have $K_{a}<1$.
$\checkmark$ The more negative the exponent power of ten, the weaker the acid is and the less tendency it has to dissociate.

## Leveling of Strong Acids

When any very strong acid $\left(K_{a} \gg 1\right)$ is added to water, its strength is said to be leveled to that of $\mathrm{H}_{3} \mathrm{O}^{+}$.

- The hydronium ion is the strongest acid that can exist in molecular form in water.
- Any stronger acid must dissociate to form $\mathrm{H}_{3} \mathrm{O}^{+}$ and its formal weak conjugate base (which has no real base character).

$$
\begin{array}{ll}
\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Cl}^{-}+\mathrm{H}_{3} \mathrm{O}^{+} & \begin{array}{l}
\text { Equilibrium lies right. } \\
\\
\Rightarrow \mathrm{HCl} \text { is leveled }
\end{array} .
\end{array}
$$

$\mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{NO}_{3}^{-}+\mathrm{H}_{3} \mathrm{O}^{+}$
Equilibrium lies right.
$\Rightarrow \mathrm{HNO}_{3}$ is leveled

## Weak Base Equilibria

$$
\begin{gathered}
\mathrm{B}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{BH}^{+}+\mathrm{OH}^{-} \\
K_{b}=\frac{\left[\mathrm{BH}^{+}\right]\left[\mathrm{OH}^{-}\right]}{[\mathrm{B}]}
\end{gathered}
$$

- $K_{b}$ is a constant for a particular base in all its solutions.
- The magnitude of $K_{b}$ indicates base strength.
$\checkmark$ Strong bases have $K_{b} \gg 1$.
$\checkmark$ Weak bases have $K_{b}<1$.
$\checkmark$ The more negative the exponent power of ten, the weaker the base is and the less tendency it has to hydrolyze.

## Leveling of Strong Bases

When any very strong base ( $K_{b} \gg 1$ ) is added to water, its strength is said to be leveled to that of $\mathrm{OH}^{-}$.

- The hydroxide ion, $\mathrm{OH}^{-}$, is the strongest base that can exist in its molecular form in water.
- Any stronger base will be leveled through hydrolysis to make $\mathrm{OH}^{-}$and the appropriate conjugate acid (which as no real acid strength).

$$
\begin{array}{cc}
\mathrm{O}^{2-}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{OH}^{-}+\mathrm{OH}^{-} & \begin{array}{l}
\text { Equilibrium lies right } \\
\\
\Rightarrow \mathrm{O}^{2-} \text { is leveled }
\end{array}
\end{array}
$$

$\mathrm{H}^{-}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{2}+\mathrm{OH}^{-}$
Equilibrium lies right $\Rightarrow \mathrm{H}^{-}$is leveled

## Ordered List of Acids and Conjugate Bases

$\checkmark$ We can construct a table of acids and their conjugate bases, ordered according to acid strength.

- Stronger acids with larger $K_{a}$ 's at the top.
- Weaker acids with smaller $K_{a}$ 's at the bottom.
$\checkmark$ Numerical values of $K_{a}$ are not listed for the truly strong acids, all of which have $K_{a} \gg 1$.
$\checkmark$ Conjugate base strength runs in the opposite sense of acid strength on the table.
- Weaker conjugate bases at the top right.
- Stronger conjugate bases at the bottom right.

TABLE OF CONJUGATE ACID-BASE PAIRS

| Acid | Base | $K_{a}\left(25^{\circ} \mathrm{C}\right)$ |
| :---: | :---: | :---: |
| $\mathrm{HClO}_{4}$ | $\mathrm{ClO}_{4}^{-}$ |  |
| $\mathrm{H}_{2} \mathrm{SO}_{4}$ | $\mathrm{HSO}_{4}^{-}$ |  |
| HCl | $\mathrm{Cl}^{-}$ |  |
| $\mathrm{HNO}_{3}$ | $\mathrm{NO}_{3}{ }^{-}$ |  |
| $\mathrm{H}_{3} \mathrm{O}^{+}$ | $\mathrm{H}_{2} \mathrm{O}$ | 1.0 |
| $\mathrm{H}_{2} \mathrm{CrO}_{4}$ | $\mathrm{HCrO}_{4}^{-}$ | $1.8 \times 10^{-1}$ |
| $\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ (oxalic acid) | $\mathrm{HC}_{2} \mathrm{O}_{4}^{-}$ | $5.90 \times 10^{-2}$ |
| $\left[\mathrm{H}_{2} \mathrm{SO}_{3}\right]=\mathrm{SO}_{2}(a q)+\mathrm{H}_{2} \mathrm{O}$ | $\mathrm{HSO}_{3}{ }^{-}$ | $1.71 \times 10^{-2}$ |
| $\mathrm{HSO}_{4}^{-}$ | $\mathrm{SO}_{4}{ }^{2-}$ | $1.20 \times 10^{-2}$ |
| $\mathrm{H}_{3} \mathrm{PO}_{4}$ | $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$ | $7.52 \times 10^{-3}$ |
| $\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right){ }_{6}{ }^{3+}$ | $\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{2+}$ | $1.84 \times 10^{-3}$ |
| $\mathrm{H}_{2} \mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}$ (o-phthalic acid) | $\mathrm{HC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}^{-}$ | $1.30 \times 10^{-3}$ |
| $\mathrm{H}_{2} \mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}($ tartaric acid) | $\mathrm{HC}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{-}$ | $1.04 \times 10^{-3}$ |
| $\mathrm{HF}_{2}{ }^{\text {a }}$ | $\mathrm{F}^{-}{ }^{-1}$ | $6.8 \times 10^{-4}$ |
| $\mathrm{Hg}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Hg}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $2.6 \times 10^{-4}$ |
| $\mathrm{HCO}_{2} \mathrm{H}$ (formic acid) | $\mathrm{HCO}_{2}{ }^{-}$ | $1.8 \times 10^{-4}$ |
| $\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{3+}$ | $\mathrm{Cr}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{2+}$ | $1.6 \times 10^{-4}$, |
| $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2} \mathrm{H}$ (benzoic acid) | $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}^{-}$ | $6.46 \times 10^{-5}$ |
| $\mathrm{HC}_{2} \mathrm{O}_{4}^{-}$(hydrogen oxalate) | $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}$ | $6.40 \times 10^{-5}$ |
| $\mathrm{HC}_{4} \mathrm{H}_{4} \mathrm{O}_{6}^{-}$(hydrogen tartrate) | $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{6}{ }^{2-}$ | $4.55 \times 10^{-5}$ |
| $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}$ (acetic acid) | $\mathrm{CH}_{3} \mathrm{CO}_{2}{ }^{-}$ | $1.76 \times 10^{-5}$ |
| $\mathrm{Be}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}{ }^{2+}$ | $\mathrm{Be}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3} \mathrm{OH}^{+}$ | $\sim 1 \times 10^{-5}$ |
| $\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{\text {+ }}$ | $\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{2+}$ | $7.9 \times 10^{-6}$ |
| $\mathrm{HC}_{8} \mathrm{H}_{4} \mathrm{O}_{4}^{-}$(hydrogen phthalate) | $\mathrm{C}_{8} \mathrm{H}_{4} \mathrm{O}_{4}{ }^{2-}$ | $3.1 \times 10^{-6}$ |
| $\mathrm{Cd}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Cd}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $8.32 \times 10^{-7}$ |
| $\mathrm{H}_{2} \mathrm{CO}_{3}$ | $\mathrm{HCO}_{3}{ }^{-}$ | $4.3 \times 10^{-7}$ |
| $\mathrm{HCrO}_{4}^{-}$ | $\mathrm{CrO}_{4}{ }^{2-}$ | $3.20 \times 10^{-7}$ |
| $\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $1.6 \times 10^{-7}$ |
| $\mathrm{H}_{2} \mathrm{~S}$ | $\mathrm{HS}^{-}$ | $1.2 \times 10^{-7}$ |
| $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$ | $\mathrm{HPO}_{4}{ }^{2-}$ | $6.23 \times 10^{-8}$ |
| $\mathrm{HSO}_{3}^{-}$ | $\mathrm{SO}_{3}{ }^{2-}$ | $6.2 \times 10^{-8}$ |
| HOCl | $\mathrm{OCl}^{-}$ | $3.0 \times 10^{-8}$ |
| $\mathrm{Pb}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Pb}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $1.5 \times 10^{-8}$ |
| HOBr | $\mathrm{OBr}^{-}$ | $2.06 \times 10^{-9}$ |
| $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Co}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $1.3 \times 10^{-9}$ |
| $\mathrm{H}_{3} \mathrm{BO}_{3}$ or $\mathrm{B}(\mathrm{OH})_{3}$ | $\mathrm{B}(\mathrm{OH})_{4}^{-}$ | $7.3 \times 10^{-10}$ |
| $\mathrm{NH}_{4}^{+}$ | $\mathrm{NH}_{3}$ | $5.65 \times 10^{-10}$ |
| $\mathrm{Zn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}{ }^{2+}$ | $\mathrm{Zn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3} \mathrm{OH}^{+}$ | $2.5 \times 10^{-10}$ |
| $\mathrm{HCO}_{3}{ }^{-}$ | $\mathrm{CO}_{3}{ }^{-2}$ | $5.61 \times 10^{-11}$ |
| $\mathrm{Ni}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Ni}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $2.5 \times 10^{-11}$ |
| HOI | $\mathrm{OI}^{-}$ | $2.3 \times 10^{-11}$ |
| $\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Fe}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $\sim 1 \times 10^{-11}$ |
| $\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Mn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $\sim 6 \times 10^{-12}$ |
| $\mathrm{Mg}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Mg}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $\sim 4 \times 10^{-12}$ |
| $\mathrm{Ag}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}{ }^{+}$ | $\mathrm{Ag}\left(\mathrm{H}_{2} \mathrm{O}\right) \mathrm{OH}(s)$ | $\sim 7 \times 10^{-13}$ |
| $\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}(\mathrm{OH})_{3}(\mathrm{~s})$ | $\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}(\mathrm{OH})_{4}^{-}$ | $\sim 4 \times 10^{-13}$ |
| $\mathrm{HPO}_{4}^{2-}$ | $\mathrm{PO}_{4}{ }^{3-}$ | $3.6 \times 10^{-13}$ |
| $\mathrm{Ca}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ | $\mathrm{Ca}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5} \mathrm{OH}^{+}$ | $3.2 \times 10^{-13}$ |
| $\mathrm{Zn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{4}(\mathrm{OH})_{2}(\mathrm{~s})$ | $\mathrm{Zn}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}(\mathrm{OH})_{3}{ }^{-}$ | (?) |
| $\mathrm{H}_{2} \mathrm{O}$ | $\mathrm{OH}^{-}$ | $1.0 \times 10^{-14}$ |
| $\mathrm{HS}^{-}$ | $\mathrm{S}^{2-}$ | $\sim 1 \times 10^{-19}$ |

## Polyprotic Acids

$\checkmark$ Each hydrolysis step of a polyprotic acid has a separate $K_{a}$.
$\boldsymbol{\checkmark}$ Successive dissociations of polyprotic acids lie progressively less to the right, so $K_{a}$ 's become smaller at each step.

Oxalic Acid:
$\mathrm{H}_{2} \mathrm{C}_{2} \mathrm{O}_{4}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{HC}_{2} \mathrm{O}_{4}^{-} \quad K_{a}=K_{1}=5.90 \times 10^{-2}$
$\mathrm{HC}_{2} \mathrm{O}_{4}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-} \quad K_{a}=K_{2}=6.40 \times 10^{-5}$
Sulfuric Acid:
$\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{HSO}_{4}^{-} \quad K_{a}=K_{1} \gg 1$
$\mathrm{HSO}_{4}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{SO}_{4}{ }^{2-} \quad K_{a}=K_{2}=1.20 \times 10^{-2}$
Sulfuric acid is a strong acid (leveled) only in its first-step hydrolysis.

## Hydrated Cations as Acids

$\checkmark$ Hydrated cations, which have a certain number of $\mathrm{H}_{2} \mathrm{O}$ molecules surrounding them (often 6), may be acidic.
$\boldsymbol{\sim}$ Hydrolysis follows the general pattern of a weak acid equilibrium:

$$
\begin{aligned}
\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{3+}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{Al}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}(\mathrm{OH})^{2+} \\
K_{a}=7.9 \times 10^{-6}
\end{aligned}
$$

$\checkmark$ Cations with high charge density, such as $\mathrm{Al}^{3+}$ and the transition metal cations, are capable of being acidic.
$\checkmark$ Cations with low charge density, such as alkali metal and heavier alkaline earth metal cations, show no appreciable acidity.

- The lightest alkaline earth cations in water, $\mathrm{Mg}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$ and $\mathrm{Ca}\left(\mathrm{H}_{2} \mathrm{O}\right)_{6}{ }^{2+}$, are extremely weak acids, as their very small $K_{a}$ values indicate.

## Conjugate Base $\boldsymbol{K}_{b}$ 's

$$
\begin{gathered}
\mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HA}+\mathrm{OH}^{-} \\
K_{b}=\frac{[\mathrm{HA}]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{A}^{-}\right]}
\end{gathered}
$$

$\boldsymbol{\checkmark} K_{b}$ 's for all the conjugates do not need to be listed, because they can be calculated from the $K_{a}$ 's of their conjugate acids.
$\boldsymbol{\checkmark} K_{b}$ 's for conjugate bases become smaller as $K_{a}^{\prime}$ 's of their conjugate acids become larger.

## Relationship Between $K_{a}$ of an Acid HA and $K_{b}$ of Its Conjugate Base $\mathbf{A}^{-}$

$$
\begin{array}{ll}
\mathrm{HA}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{A}^{-} & K_{a}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]} \\
\mathrm{A}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HA}+\mathrm{OH}^{-} & K_{b}=\frac{[\mathrm{HA}]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{A}^{-}\right]}
\end{array}
$$

$$
2 \mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-} \quad K_{w}=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]
$$

$$
K_{a} \times K_{b}=\frac{\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]} \frac{[\mathrm{HA}]\left[\mathrm{OH}^{-}\right]}{\left[\mathrm{A}^{-}\right]}
$$

$$
=\left[\mathrm{H}_{3} \mathrm{O}^{+}\right]\left[\mathrm{OH}^{-}\right]=K_{w}
$$

## Relationship Between $K_{a}$ and $K_{b}$ for a Conjugate Pair

For an acid HA and its conjugate base $\mathrm{A}^{-}$, or a base B and its conjugate acid $\mathrm{BH}^{+}$, the relationship between the hydrolysis constants for the conjugate pair is given by

$$
\begin{aligned}
K_{a}^{\mathrm{HA}} K_{b}^{\mathrm{A}^{-}} & =K_{w} \\
K_{b}^{\mathrm{B}} K_{a}^{\mathrm{BH}^{+}} & =K_{w}
\end{aligned}
$$

## When are conjugate bases real bases?

$\boldsymbol{\sim}$ Conjugate bases of weak acids are true bases.
Example: Acetate ion, $\mathrm{OAc}^{-}$, the conjugate base of acetic acid, HOAc.

$$
\begin{aligned}
\mathrm{OAc}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons & \mathrm{HOAc}+\mathrm{OH}^{-} \\
& K_{b}\left(\mathrm{OAc}^{-}\right)=K_{w} / K_{a}(\mathrm{HOAc})=5.68 \times 10^{-10}
\end{aligned}
$$

A solution of sodium acetate, NaOAc , will be basic.

$$
\begin{array}{rl}
\mathrm{NaOAc} \rightarrow \mathrm{Na}^{+}+ & \mathrm{OAc}^{-} \\
\mathrm{OAc}^{-}+\mathrm{H}_{2} \mathrm{O} & \mathrm{HOAc}+\mathrm{OH}^{-}
\end{array}
$$

## When are conjugate bases not basic?

$\checkmark$ Aprotic (no ionizable $\mathrm{H}^{+}$) anions of strong acids are not basic, except in a formal sense.

Example: Chloride ion, $\mathrm{Cl}^{-}$, the conjugate base of hydrochloric acid, HCl .

$$
\begin{aligned}
& \mathrm{Cl}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HCl}+\mathrm{OH}^{-} \\
& \quad \text { Equilibrium lies completely left! } \\
& K_{b}\left(\mathrm{Cl}^{-}\right)=K_{w} / K_{a}(\mathrm{HCl})=1 \times 10^{-14} /(\gg 1)=\ll 1 \times 10^{-14}
\end{aligned}
$$

A solution of NaCl will be neutral.

$$
\mathrm{NaCl}>\mathrm{Na}^{+}+\mathrm{Cl}^{-}
$$

$$
\mathrm{pH}=7
$$

## Polyprotic Conjugate Bases

$\checkmark$ Aprotic conjugate bases of polyprotic acids can function as polyprotic bases, whose $K_{b}$ values can be calculated from the $K_{a}$ values of their conjugate acids.

$$
\begin{gathered}
\mathrm{CO}_{3}{ }^{2-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{HCO}_{3}^{-}+\mathrm{OH}^{-} \\
K_{b}=K_{w} / K_{a}\left(\mathrm{HCO}_{3}^{-}\right)=1.0 \times 10^{-14} / 4.8 \times 10^{-11}=2.1 \times 10^{-4}
\end{gathered}
$$

$$
\mathrm{HCO}_{3}^{-}+\mathrm{H}_{2} \mathrm{O} \rightleftharpoons\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]+\mathrm{OH}^{-}
$$

$$
K_{b}=K_{w} / K_{a}\left(\mathrm{H}_{2} \mathrm{CO}_{3}\right)=1.0 \times 10^{-14} / 4.2 \times 10^{-7}=2.4 \times 10^{-8}
$$

$\boldsymbol{\sim} K_{b}$ values become progressively smaller with successive hydrolyses.

## Tabulated $\boldsymbol{K}_{\boldsymbol{b}}$ Values

$\boldsymbol{\checkmark} K_{b}$ values for neutral weak bases are frequently given in tables.

| Base | $\mathrm{NH}_{3}$ | $\mathrm{CH}_{3} \mathrm{NH}_{2}$ | $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NH}_{2}$ | $\left(\mathrm{CH}_{3}\right)_{3} \mathrm{~N}$ |
| :--- | :---: | :---: | :---: | :---: |
| $K_{b}$ | $1.8 \times 10^{-5}$ | $4.4 \times 10^{-4}$ | $6.4 \times 10^{-4}$ | $6.4 \times 10^{-5}$ |

$\checkmark K_{a}$ values for conjugate acids can be calculated from $K_{a}$ $\times K_{b}=K_{w}$.
$\checkmark$ Sometimes conjugate acids and their $K_{a}{ }^{\prime}$ s appear in acid tables, from which $K_{b}$ 's for the neutral bases can be calculated, using $K_{a} \times K_{b}=K_{w}$.

## $\mathrm{p} K_{a}$ and $\mathrm{p} K_{b}$

$\boldsymbol{\checkmark} K_{a}$ and $K_{b}$ values are often listed as their negative base10 logarithms.

$$
\begin{array}{r}
\mathrm{p} K_{a}=-\log K_{a} \\
\mathrm{p} K_{b}=-\log \mathrm{p} K_{b}
\end{array}
$$

$\checkmark$ The larger the positive value of $\mathrm{p} K$, the smaller the value of $K$ is.
$\boldsymbol{\checkmark}$ Strong acids and bases have negative values of $\mathrm{p} K_{a}$ and $\mathrm{p} K_{b}$, respectively.
